Topic: Factors and Multiples

| Topic/Skill | Definition/Tips | Example |
| :---: | :---: | :---: |
| 1. Multiple | The result of multiplying a number by an integer. <br> The times tables of a number. | The first five multiples of 7 are: $7,14,21,28,35$ |
| 2. Factor | A number that divides exactly into another number without a remainder. <br> It is useful to write factors in pairs | The factors of 18 are: $1,2,3,6,9,18$ <br> The factor pairs of 18 are: $\begin{gathered} 1,18 \\ 2,9 \\ 3,6 \\ \hline \end{gathered}$ |
| 3. Lowest <br> Common <br> Multiple <br> (LCM) | The smallest number that is in the times tables of each of the numbers given. | The LCM of 3, 4 and 5 is 60 because it is the smallest number in the 3,4 and 5 times tables. |
| 4. Highest Common Factor (HCF) | The biggest number that divides exactly into two or more numbers. | The HCF of 6 and 9 is 3 because it is the biggest number that divides into 6 and 9 exactly. |
| 5. Prime Number | A number with exactly two factors. <br> A number that can only be divided by itself and one. <br> The number $\mathbf{1}$ is not prime, as it only has one factor, not two. | The first ten prime numbers are: $2,3,5,7,11,13,17,19,23,29$ |
| 6. Prime Factor | A factor which is a prime number. | The prime factors of 18 are: $2,3$ |
| 7. Product of Prime Factors | Finding out which prime numbers multiply together to make the original number. <br> Use a prime factor tree. <br> Also known as 'prime factorisation'. | $\begin{gathered} 36=2 \times 2 \times 3 \times 3 \\ \text { or } 2^{2} \times 3^{2} \end{gathered}$ <br> (2) |
