| Topic/Skill | Definition/Tips | Example |
| :---: | :---: | :---: |
| 1. Quadratic | A quadratic expression is of the form $a x^{2}+b x+c$ <br> where $a, b$ and $c$ are numbers, $\boldsymbol{a} \neq \mathbf{0}$ | Examples of quadratic expressions: $\begin{gathered} x^{2} \\ 8 x^{2}-3 x+7 \end{gathered}$ <br> Examples of non-quadratic expressions: $\begin{gathered} 2 x^{3}-5 x^{2} \\ 9 x-1 \\ \hline \end{gathered}$ |
| 2. Factorising Quadratics | When a quadratic expression is in the form $x^{2}+b x+c$ find the two numbers that add to give $b$ and multiply to give $c$. | $x^{2}+7 x+10=(x+5)(x+2)$ <br> (because 5 and 2 add to give 7 and multiply to give 10 ) $x^{2}+2 x-8=(x+4)(x-2)$ <br> (because +4 and -2 add to give +2 and multiply to give -8) |
| 3. Difference of Two Squares | An expression of the form $\boldsymbol{a}^{2}-\boldsymbol{b}^{2}$ can be factorised to give $(\boldsymbol{a}+\boldsymbol{b})(\boldsymbol{a}-\boldsymbol{b})$ | $\begin{aligned} x^{2}-25 & =(x+5)(x-5) \\ 16 x^{2}-81 & =(4 x+9)(4 x-9) \end{aligned}$ |
| 4. Solving Quadratics $\left(a x^{2}=b\right)$ | Isolate the $x^{2}$ term and square root both sides. <br> Remember there will be a positive and a negative solution. | $\begin{gathered} 2 x^{2}=98 \\ x^{2}=49 \\ x= \pm 7 \end{gathered}$ |
| 5. Solving Quadratics $\left(a x^{2}+b x=\right.$ 0) | Factorise and then solve $=0$. | $\begin{gathered} x^{2}-3 x=0 \\ x(x-3)=0 \\ x=0 \text { or } x=3 \end{gathered}$ |
| 6. Solving Quadratics by Factorising ( $a=1$ ) | Factorise the quadratic in the usual way. Solve $=0$ <br> Make sure the equation $=0$ before factorising. | Solve $x^{2}+3 x-10=0$ <br> Factorise: $\begin{gathered} (x+5)(x-2)=0 \\ x=-5 \text { or } x=2 \end{gathered}$ |
| 7. Factorising Quadratics when $a \neq 1$ | When a quadratic is in the form $a x^{2}+b x+c$ <br> 1. Multiply a by $\mathrm{c}=\mathrm{ac}$ <br> 2. Find two numbers that add to give $b$ and multiply to give ac. <br> 3. Re-write the quadratic, replacing $b x$ with the two numbers you found. <br> 4. Factorise in pairs - you should get the same bracket twice <br> 5. Write your two brackets - one will be the repeated bracket, the other will be made of the factors outside each of the two brackets. | $\text { Factorise } 6 x^{2}+5 x-4$ <br> 1. $6 \times-4=-24$ <br> 2. Two numbers that add to give +5 and multiply to give -24 are +8 and -3 <br> 3. $6 x^{2}+8 x-3 x-4$ <br> 4. Factorise in pairs: $\begin{array}{r} 2 x(3 x+4)-1(3 x+4) \\ \text { 5. Answer }=(3 x+4)(2 x-1) \end{array}$ |
| 8. Solving Quadratics by Factorising $(a \neq 1)$ | Factorise the quadratic in the usual way. Solve $=0$ <br> Make sure the equation $=0$ before factorising. | Solve $2 x^{2}+7 x-4=0$ <br> Factorise: $\begin{aligned} & (2 x-1)(x+4)=0 \\ & x=\frac{1}{2} \text { or } x=-4 \end{aligned}$ |
