| Topic/Skill | Definition/Tips | Example |
| :---: | :---: | :---: |
| 1. Linear Sequence | A number pattern with a common difference. | $2,5,8,11 \ldots$ is a linear sequence |
| 2. Term | Each value in a sequence is called a term. | In the sequence $2,5,8,11 \ldots, 8$ is the third term of the sequence. |
| 3. Term-toterm rule | A rule which allows you to find the next term in a sequence if you know the previous term. | First term is 2. Term-to-term rule is 'add 3' <br> Sequence is: $2,5,8,11 \ldots$ |
| 4. nth term | A rule which allows you to calculate the term that is in the nth position of the sequence. <br> Also known as the 'position-to-term' rule. $\mathbf{n}$ refers to the position of a term in a sequence. | nth term is $3 n-1$ <br> The $100^{\text {th }}$ term is $3 \times 100-1=299$ |
| 5. Finding the nth term of a linear sequence | 1. Find the difference. <br> 2. Multiply that by $n$. <br> 3. Substitute $n=1$ to find out what number you need to add or subtract to get the first number in the sequence. | Find the nth term of: $3,7,11,15 \ldots$ <br> 1. Difference is +4 <br> 2. Start with $4 n$ <br> 3. $4 \times 1=4$, so we need to subtract 1 to get 3 . <br> nth term $=4 n-1$ |
| 6. Fibonacci type sequences | A sequence where the next number is found by adding up the previous two terms | The Fibonacci sequence is: $1,1,2,3,5,8,13,21,34 \ldots$ <br> An example of a Fibonacci-type sequence is: $4,7,11,18,29 \ldots$ |
| 7. Geometric Sequence | A sequence of numbers where each term is found by multiplying the previous one by a number called the common ratio, $\mathbf{r}$. | An example of a geometric sequence is: $2,10,50,250 \ldots$ <br> The common ratio is 5 <br> Another example of a geometric sequence is: $81,-27,9,-3,1 \ldots$ <br> The common ratio is $-\frac{1}{3}$ |
| 8. Quadratic Sequence | A sequence of numbers where the second difference is constant. <br> A quadratic sequence will have a $n^{2}$ term. |  |
| 9. nth term of a geometric sequence | $a r^{n-1}$ <br> where $a$ is the first term and $r$ is the common ratio | The nth term of $2,10,50,250 \ldots$. Is $2 \times 5^{n-1}$ |

| 10. nth term of a quadratic sequence | 1. Find the first and second differences. <br> 2. Halve the second difference and multiply this by $n^{2}$. <br> 3. Substitute $n=1,2,3,4 \ldots$ into your expression so far. <br> 4. Subtract this set of numbers from the corresponding terms in the sequence from the question. <br> 5. Find the nth term of this set of numbers. <br> 6. Combine the nth terms to find the overall nth term of the quadratic sequence. <br> Substitute values in to check your nth term works for the sequence. | Find the nth term of: $4,7,14,25,40$.. <br> Answer: <br> Second difference $=+4 \rightarrow$ nth term $=$ $2 n^{2}$ <br> Sequence: $4,7,14,25,40$ <br> $2 n^{2} \quad 2,8,18,32,50$ <br> Difference: $2,-1,-4,-7,-10$ <br> Nth term of this set of numbers is $-3 n+5$ <br> Overall nth term: $2 n^{2}-3 n+5$ |
| :---: | :---: | :---: |
| 11. Triangular numbers | The sequence which comes from a pattern of dots that form a triangle. $1,3,6,10,15,21 \ldots$ | $\begin{array}{cccc} 1 & 3 & 6 & 10 \\ 0 & 0 & 0 & 0 \\ & 0 & 0 & 0 \\ & & 0 & 0 \\ & & 0 & 0 \end{array}$ |
